The Latest Report Brings Good & Bad News About House Prices

Why is the housing market important to the economy?

The housing market is closely linked to consumer spending. When house

prices go up, homeowners become better off and feel more confident.

Some people will borrow more against the value of their home, either to

spend on goods and services, renovate their house, supplement their

pension, or pay off other debt.

When house prices go down, homeowners risk that their house will be

worth less than their outstanding mortgage. People are therefore more

likely to cut down on spending and hold off from making personal

investments.

Mortgages are the greatest source of debt for households in the UK.

If many people take out large loans compared to their income or the

value of their house, this can put the banking system at risk in an

economic downturn.

Housing investment is a small but unpredictable part of how we measure the total output of the economy. If you buy a newly built home,

it directly contributes to total output (GDP),

for example through investment in land and building materials as well

as creating jobs. The local area also profits when new houses are built

as newcomers will start using local shops and services.

Buying and selling existing homes does not affect GDP in the same

way. The accompanying costs of a house transaction still benefit the

economy, however. These can include anything from estate agent, legal or

surveyor fees to buying a new sofa or paint.

Why do house prices change?

House prices have changed a lot over time.

The average house price was a little over £10,000 back in 1977. Roll

forward 40 years and the average price has risen to £200,000. Even with

the general increase in the prices of goods and services, house prices

are now around three times as expensive as they were in the

late 1970s.

For one thing, house prices tend to rise if people expect to be

richer in the future. Normally that happens when the economy is doing

well as more people are in work and wages are higher.

House prices also tend to rise if more people are able to borrow

money to buy houses. The more lending banks and building societies are

willing to provide, the more people can buy a house and prices will

rise.

The Bank of England also affects house prices through setting the key

interest rate in the economy. The lower interest rates are, the lower

the cost of borrowing to pay for a house is, and the more people are

able to afford to borrow to buy a house. That will also mean prices will

tend to be higher.

There are also more fundamental reasons why house prices may change.

For instance, demand for housing may rise if the population is increasing or there are more single-person households. Growing demand

usually means higher house prices.

Prices will also tend to be higher if fewer houses are built, reducing the supply of housing. The fewer houses that are built, the

more people will need to compete by increasing the amount of money they

are willing to spend to buy a house

There have also been times when house prices have increased a lot

just because people think prices will continue to rise. This is called a

housing market bubble. Bubbles are always followed by housing market

crashes when house prices fall sharply.

This happened in the 1980s. Between 1984 and 1989 house prices doubled, which was much higher than the growth in people's earnings. The unsustainable rise was followed by over five years of falling house prices. It then took until 1999 before house prices had recovered to the level they were in 1989.
